

STATE AND FIXED POTENTIAL

Complete represented state x
One declared, single-valued V

GENERATOR

Declared generator
Unique admissible flow
Duration and controls
supply endpoints

FINITE ENDPOINT VALUE

$E = V(\text{before}) - V(\text{after})$
Regular path: $E = \text{negative integral of } dV$

COMPLETE COALITION TABLE

One baseline, field and comparison protocol
Every required subset is defined and physically scoped

INTERACTION AND EXACT DISCRETE TAYLOR

Alternating differences = Mobius coefficients
Recursion; unique multilinear reconstruction without remainder

CANONICAL DENSITY: ADDITIONAL ASSUMPTIONS

Positive $p = \exp(-V) / Z$ in one fixed reference measure
EBU and its interactions become log-density contrasts

P4 ENTROPY: NARROWER PHYSICAL SCOPE

Fixed conservative single-reservoir equilibrium; no omitted work
Medium entropy change = $k_B E$; system change = $-k_B E$
