

DECLARE THE RESPONSE

Initial state, controls, background and physical boundary
One well-posed generator; one evaluation horizon

COMPLETE ENDPOINTS

A trajectory for each coalition
Include pending stock and valued sinks
Retain the no-action background

TEMPORAL MODES

Rates and eigenvalues
Decay and oscillation
Timing of the response

ONE FINITE COMPARISON

$E(S) = V(\text{initial}) - V(\text{endpoint of } S)$
Relative table: subtract the common no-action change

COALITION INTERACTION

Apply the same Mobius differences to endpoint values.
Common linear response + quadratic V: no orders above pairs.
Temporal modes do not determine coalition order.
