

POTENTIAL $V(x)$

State geometry

Curvature and higher derivatives

RESPONSE $x(z)$

Action-to-state mechanism

Mixed control dependence

COMPOSITE $G(z) = V(x(z))$

Smooth chain rule combines both sources.

Finite interaction belongs to this composite.

WHAT THE ENDPOINT TABLE IDENTIFIES

The total coefficient: $m_E(T) = -\Delta_T G(0)$

A unique multilinear representation on the Boolean cube

The origin split also uses the declared smooth response.

Quadratic V + nonlinear response can have higher-order interaction.
